CONFIDENTIAL - NOT FOR PUBLIC RELEASE

Summary and Recommendation

A recommendation of **LOWER PRIORITY FOR FURTHER ACTION** is proposed for the Suffolk Airport C&D Site. Existing analytical data support a strong potential for a release of contaminants to groundwater. Once supporting quality assurance data become available, an observed release should be documentable. Over 50,000 people obtain drinking water from public supply wells that draw from a highly permeable surficial aquifer. The groundwater migration pathway, therefore, is of primary concern. The site is also located within the boundaries of two terrestrial sensitive environments.
